

ANALOG OR DIGITAL GAS DETECTORS DATASHEET

cGas DETECTOR for VRF, PTAC & VTAC

Designed for use in publicly occupied and frequented spaces. Ideal for continuous monitoring of refrigerants where high-efficiency, high volume refrigerant cooling and heating systems (VRF) are used to keep the indoor environment comfortable. The low profile, aesthetically pleasing enclosure is designed to reduce the noticeability of the device by the public eye. It is secured by a mounting plate that can be mounted proud of the wall or flush with the wall using a junction box. The model with the remote refrigerant sensor has a 9m / 29.5ft dangle cable that is ideal for use in packaged terminal air conditioner (PTAC) applications.

Both the analog and digital models are powered by 24 VDC or ground referenced AC, come with an LCD display, temperature compensation and thermal resetting fuse. Sensor replacement is easy with true Plug & Play smart sensors that arrive pre-calibrated. The firmware and configuration can be upgraded in the field using the USB connection.

The digital models are user configurable in the field for BACnet® MS-TP RS-485 or Modbus® RTU RS-485 output for communicating with a controller, Building Automation System or other control panel.

In packaged terminal air conditioner (PTAC) applications, the remote sensor model offers flexible placement options for the sensor, making it easier to place the sensor as close to the potential leak area as possible.

The remote sensor should be mounted near the air conditioner coil and connected to the cGas Detector with 18 awg wire stranded in conduit. The maximum length of wire between the remote sensor and the transmitter should not exceed 50 ft (15 m).

For vertical terminal air conditioner (VTAC) applications, the internal sensor model is ideal for mounting flush with the wall, 6 in / 15 cm from the finished floor close to the air conditioning unit.

The cGas Detector has configurable Low, Mid and High alarm setpoints. The alarm setpoint value entered is the exact number/level of gas concentration at which the device will indicate an alarm condition and send a signal to the controller or Building Automation System (BAS) which in turn will trigger an alarm device and/or emergency protocol is required to warn of the hazard and keep occupants safe.
